

COMPETITIVE COMPARISON

TheraBase™

Self-Adhesive Calcium Releasing Base/Liner

VS

Glass Ionomers/ Resin-Modified Glass Ionomers Cements

1 Calcium & Fluoride Release

Calcium release **generates an alkaline pH¹**, which **promotes pulp vitality.²**

2 Easy Auto-Mix Dual-Syringe Delivery

TheraBase's **easy and fast auto-mix dual-syringe** provides a consistent mix for immediate delivery.

3 High Compressive Strength

Compressive strength of TheraBase is **greater** than glass ionomers and RMGI base/liner products.*

Compressive
Strength

No Calcium Release

Glass ionomers and resin-modified glass ionomers have fluoride release but **do not contain or release calcium.**

Manual Mixing

Glass ionomers or resin-modified glass ionomers typically **require manual mixing, trituration, or a special dispenser.**

Low Compressive Strength

Glass ionomers and RMGIs have **lower compressive strength** than TheraBase, making them less durable and more prone to fracture.*

Compressive
Strength

COMPETITIVE COMPARISON

TheraBase™

Self-Adhesive Calcium Releasing Base/Liner

vs

Calcium-Releasing Base/Liner Materials

1 High Calcium & Fluoride Release

Calcium release **generates an alkaline pH¹**, which **promotes pulp vitality.²**

Low Calcium & Fluoride Release

Other Calcium-releasing base/liner materials release **lower amounts of fluoride and calcium.***

2 High Radiopacity

TheraBase is **more radiopaque** than other calcium-releasing base/liner materials allowing for **easy identification on radiographs and effective diagnosis.***

Low Radiopacity

Other Calcium-releasing base/liner materials have **lower radiopacity** making them **hard to be identified on radiographs.***

3 High Compressive Strength

Compressive strength of TheraBase is **much greater** than other calcium-releasing base/liner materials.*

Compressive Strength

Low Compressive Strength

Other calcium-releasing base/liner materials have **lower compressive strength**, making them **less durable and more prone to fracture.***

Compressive Strength

COMPETITIVE COMPARISON

TheraBase™

Self-Adhesive Calcium Releasing Base/Liner

vs

Flowable Composites Base/Liners

1 Calcium & Fluoride Release

Calcium release generates an alkaline pH², which promotes pulp vitality.²

2 Self-Adhesive

With TheraBase there is **NO** need for an adhesive prior the placement of the material. **Save a Step! Save \$! Save Time!**

3 Light-Cured & Dual-Cured

TheraBase is **dual-cured** allowing for “a peace of mind” that the material will fully cure even in deep restorations where light cannot reach.

No Calcium & Fluoride Release

Flowable composites do not release calcium and fluoride.

Requires Adhesive

Flowable composites **require** an adhesive in order to bond to tooth structure, adding an extra cost and an extra step in the restoration!

Only Light-Cured

Most flowable composites are **only light-cured** materials, making them **non ideal** for deep restorations when light might be hard to reach.
